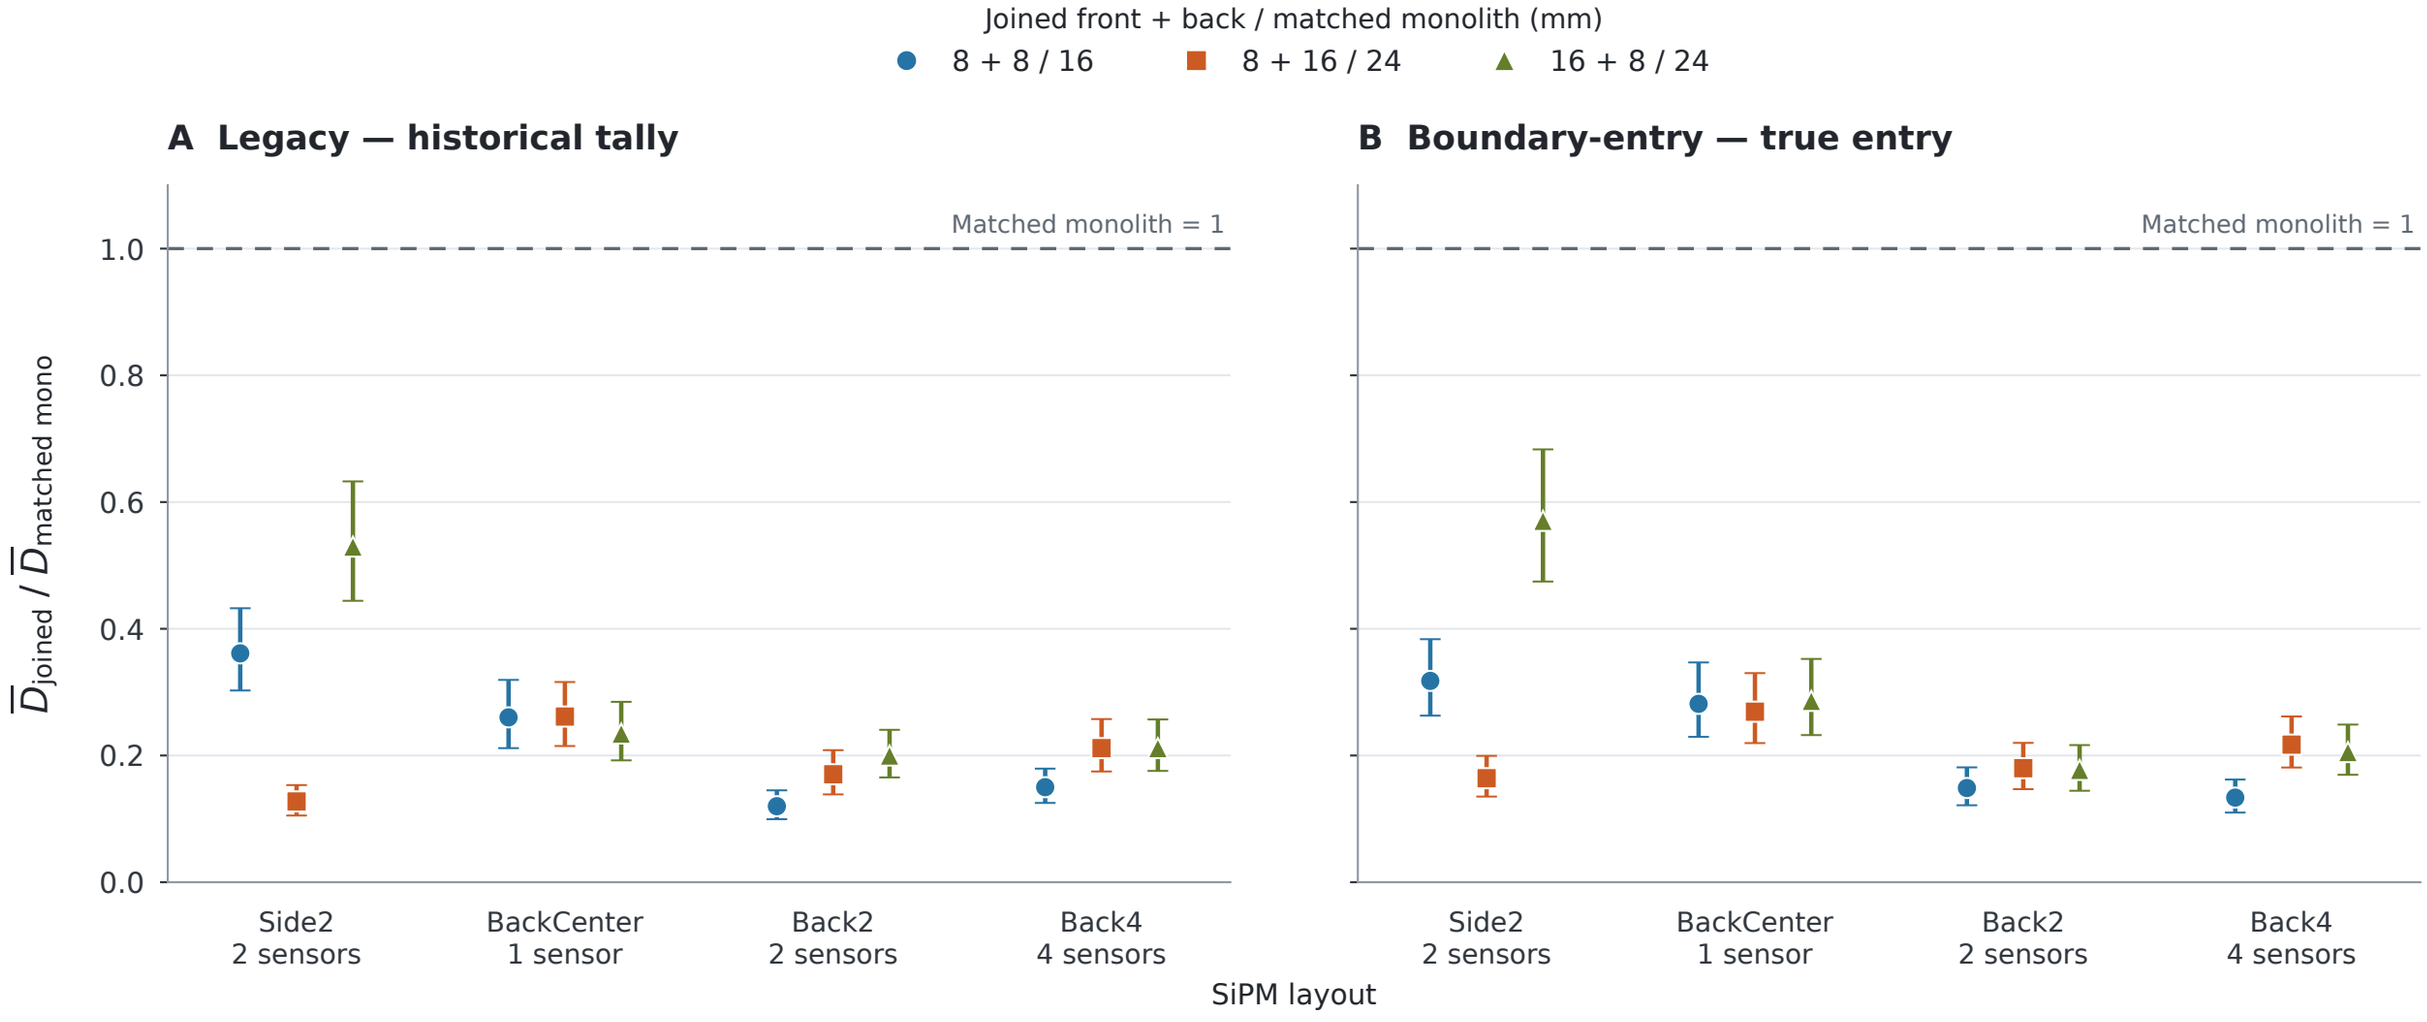
Joining response across four SiPM layouts

One 100 × 100 mm EJ-200 assembly; 0.1 mm EJ-550 in joined cases



D is the mean sensor tally per source β event; 200 events/configuration, including misses and zero response. No PDE model.

Pointwise 95% percentile bootstrap intervals (10,000 draws); shared controls reused. No multiplicity adjustment or equivalence test.

Legacy false detections stop tracks; the historical tally is not a corrected-transport counterfactual.
